Tutorial - 05

Quest

Using BFs, we can find the minimum number of nodes between source node and distination node, while thing DFs, we can find if a path exist between two nodes.

Application of DPs:-

1) Detecting cycle in a graph.

- 2) finding path between two given vertices USV
- 3) Topological sorting can be done using DFS.

Application of 38 PS 1-

- 1) Like DFS, BFS may also be used for deterting cycles in graph.
- &) fluding shortest fath and minimum spanning tree in unweighted graph.
- 3) In networking, finding a route for packet transmission.

Ques a

which date structures are used for Emplementing BPS and DPS 4 why?

DPs uses stack date structure as order doesn't has much importance.

Ble uses queue date structure as order matters in

Ques 3

Sparse Graph: Graph in which no. of edges is much less than the possible no. of edges.

Dense Graph: - Graph in which no. of edges is close to the moximal no. of edges

If the graph is sparse, we should store it as a list of edges. Atternatively, if it is dense, we should store it as adjacency matrix.

Ques 4

Detecting a cycle in graph using BB:-

1) complete in degree (no. of incoming edges) for each of the verten present in nodes graph & could no. of nodes =0

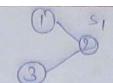

- 2) pick all vertices with indegree as o and add them to queue 3) Kemore o verten from the queue, them incurrent count increment count by 1 and decrease in degree by 1. for all neighbours if in-degree of a neighbouring node is 0. add to queue.
- 4) Repeat step 3 untill queue is empty
- 5) of no. of visited nodes is not equal to no. of nodes, then graph has a cycle.

Esmilar process is done in Drs as well, but in Drs, we has the option of doing recursive called for vertices which are adjocent to the current node 4 are not get visited. If recursive function returns false, then graph does not have a cycle.

Quess

Pisjoint Set: - It allows to find out whether the a elements are in the same set or not efficiently. The disjoint set can be divided as the subsets where there is no common element between a sets.

S1 = {1,2,3} S2 = {4,516}

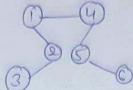

Operations: -

Dunion: - merge a sets when edge is added.

8,052=33=

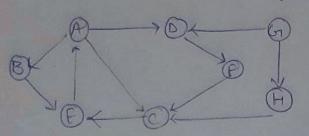

find :- tells which element belong to which sets find (1) = 8, , find (5) = 82

3) Intersection: - S, NS2 = {0}, Sy NS5 = {6}.

clus 6

Kun Brs and Drs on given graph

BFS :- modes GHFDCEAB

parent Keling HCEA

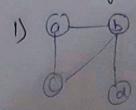

Visited modes - GHFDEAB

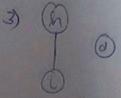

path G -> H-> C-> C-1 A-1 B

DPS: modes
processed Gr G DC E AB
stack G DPH CPH APH 8FH PH
bath -> G -> D -> C -> E -> A -> B

Ques 7

find out no. of connected components 4 vertices in each group. Using disjoint set data structure.

70.((c)=4 70.((c)=1 mo(v)=3

No-(v)=3

Ques 8 Hack 0 1 3 2 4 5 Topological: 5; 4; 2; 3;1;0 DPS Stack -> [4/0/1/3/2/5] Head-> we can use heaps to implement priority queue se will Ques 9 taken O(logn) time to insert & delete each element in the priority queue. Based on heap structure, priority queue has also a types -> max & min, priority queue. some algorithms where we need to use priority queue: Dijkrstro's shortest path also using priority queue: - where graph is sorted in the form of adjacently set of matrix, priority queue can be used minimum efficiently when implementing Dijkstro's algorithm. to store keys of nodes 4 entroit minimum key node at every step. ini) <u>Pata compression</u>: - Priority queue is used in Huffmon's code which is used to compress data. In minimum Heap, the key is present at the root node must be smaller than among the keys present at all of Questo its collection 6 6 P

In mon Heaf, the key present at the root node must be greater than among the keys present at all of its collection.
